

TicketChain

Jury navigation guide · BTS FinTech Summer School — Geneva

1. Live interactive presentation

<https://ticket-chain-six.vercel.app/pitch>

A scrolling, single-page version of the pitch, built directly into the product: problem & persona, market matrix, sourced evidence on ticket fraud and resale (real UK/EU statistics with links), why blockchain, the 17/17 on-chain validation, our own survey results, the live demo run-of-show, business model, and closing ask.

Useful detail: on the “Live demo” slide there is a small form (Concert ID / Ticket ID). Filling it in and clicking “Prepare real shortcuts” turns the 6 demo steps into direct links that open the exact right page of the live app, pre-loaded with the real IDs used in the walkthrough — no need to search for anything manually during the demo.

Quick navigation anchors at the top of the page: Start · Proof · Live demo · Closing.

2. GitHub repository — explore or run it yourselves

<https://github.com/adam92igo/ticketChain>

The full source code: the Solidity smart contract, the Next.js frontend, and every business document behind this project. You do not need to install anything to review it — but you can also run the tool yourselves, or connect your own MetaMask wallet to the live deployment (free Sepolia test network, no real funds involved).

README.md	Setup instructions, architecture overview, current live contract address.
contracts/TicketChain.sol	The smart contract itself — ERC-721 tickets, resale cap, cancellation, holder-proof.
docs/PROJECT_CONTEXT.md	Technical and product overview of the whole system.
docs/bts-assignment/	All business deliverables: persona, unit economics & GTM, communication strategy, validation results.
scripts/validate-live-deployment.ts	The script behind the 17/17 automated on-chain proof, runnable against the live contract.

To try it hands-on: install the MetaMask browser extension, get free Sepolia test ETH from a faucet (e.g. alchemy.com/faucets), then open the live app link below and connect your wallet — no local install required.

3. The live application — route map

<https://ticket-chain-six.vercel.app>

Same deployment as the presentation above — these are its functional pages.

Route	What it's for	Wallet needed?
/	Home / landing page	No

Route	What it's for	Wallet needed?
/about	Problem, solution, why blockchain — explainer	No
/demo	Presentation / operator run-of-show	No
/concerts	Browse live on-chain concerts, buy a ticket	Yes, to buy
/tickets	"My Tickets" — owned NFTs, list for resale	Yes
/marketplace	Browse & buy resale listings (price-capped)	Yes, to buy
/verify	Check any ticket's authenticity & status by ID	No, read-only
/organizer	Admin portal — create concerts, partner-sale mint, cancel	Yes, owner wallet
/gate	Entry control — holder-proof challenge/scan, mark as used	Yes
/pitch	This interactive presentation itself	No

4. Independent, on-chain proof

Every transaction shown in the demo can be checked independently, with no need to trust us:

Contract (Sepolia testnet): 0xc9f91d1Fcb5203152b3cAb6E320df11eDFe884259

[View the contract on Etherscan](#)

5. Quick tips

- Read-only pages (/about, /demo, /verify) work in any browser — no wallet required to explore them.
- Wallet-required actions (buy, list, create, mark as used) need MetaMask connected to the Sepolia test network — test ETH is free from a faucet, no real funds are ever involved.
- If something looks empty or a concert has disappeared after being cancelled, that's expected: cancelled concerts are intentionally hidden everywhere in the interface rather than shown as "cancelled".
- All business documents (persona, market evidence, unit economics, GTM, communication strategy, on-chain validation results) live under docs/bts-assignment/ in the repository.
